

Author Guidelines

Home / Canadian Journal of Forest Research / **Author Guidelines**

Les lignes directrices de l'auteur sont disponibles [en](#)
[français](#)

Prepare your manuscript

Format and style

Manuscript text must:

- be in English or French,
- be double-spaced,
- be single column,
- include page numbers,
- include continuous line numbers, and
- be 8.5 x 11 inches in page size (or ISO A4).
- For Research articles, follow this order: title page, abstract, keywords, body text (Introduction, Materials and methods, Results, Discussion), acknowledgements, and references. Tables, figures, figure captions, and appendices may be uploaded separately or within the manuscript file. For other article types, refer to journal-specific guidelines.

Abbreviations and acronyms

Abbreviations should be used minimally. Abbreviate only widely used terms and terms that are used extensively in the manuscript. Abbreviations and acronyms must be defined when they are first mentioned in the text, as well as the first instance of use in the Abstract and figure captions.

Footnotes

AUTHOR GUIDELINE S

[Prepare your
manuscript](#)

[Parts of the
manuscript](#)

[Main body of
the article](#)

[Author
statements](#)

[References](#)

[Tables and
Figures](#)

[Appendices](#)

[Supplementar
y files](#)

[Multimedia
files](#)

[Guidelines per
journal](#)

In the main body of the manuscript, footnotes should be avoided if possible. If unavoidable, footnotes should be cited using superscript Arabic numbers (1,2,3), in the order of appearance (beginning with the title page), and the footnote should be included at the bottom of the page on which it is cited. Footnotes should not be included in the reference list.

In tables, footnotes should be cited using symbols (in the order *, †, ‡, §, ||, ¶, #) or superscript lowercase italic letters (*a,b,c*).

Mathematical expressions

- Identify equations by calling out with numbers in parentheses placed flush with the left margin (for the Canadian Journal of Physics, place on the right).
- A letter or symbol should represent only one entity and be used consistently throughout the paper.
- Each variable (including those representing vectors, matrices, and tensors) must be clearly identified and defined in the text.
- Supply complex equations in an editable format by using LaTeX or a math editor (MathType).
- Supply simple, inline equations in the word processing program, without using MathType. Insert symbols using “normal text” or “Symbol” fonts only with the correct Unicode (hex) values. Insert symbols using MathType ONLY if they cannot be inserted as normal text symbols.

Race and ethnicity

We endorse participant diversity and collection of robust demographic data. Because both race and ethnicity are socio-political constructs, not biological facts, authors should take care to:

- use precise, respectful language to describe study participants, avoiding potentially stigmatizing terms;
- collect other kinds of data that could explain population differences (e.g., age, sex, region, immigration status, income, education);

- explain in the Methods
 - how race/ethnicity were defined, and by whom;
 - who classified participants according to race/ethnicity;
 - why race/ethnicity were assessed in the study;
- report data that are disaggregated by race/ethnicity in the Results; and
- discuss the potential implications of race/ethnicity on the study results and analyses.

Reporting guidelines

Authors are encouraged to use reporting guidelines to enhance the transparency and reproducibility of their work. Up-to-date guidelines can be found at the [EQUATOR Network](#), where authors may [search](#) or [consult the GoodReports wizard](#) to identify which guideline(s) to use. Page or line numbers should be used to identify each checklist item in the manuscript. **A completed checklist may be requested by the editor and is required by some CSP journals. Consult journal-specific guidelines for more information.** Commonly used and well recognized reporting guidelines and checklists include:

- Animal in vivo studies: [ARRIVE 2.0](#) and full [ARRIVE checklist](#)
- Animal observational studies: STROBE-Vet and [STROBE-Vet checklist](#)
- Clinical case reports: [CARE](#)
- Observational studies: [STROBE](#)
- Randomized controlled trials in humans: [CONSORT](#)
A clinical trial is any investigation that evaluates the effects of one or more health-related interventions on participant health outcomes. Interventions include—but are not restricted to—drugs, medical devices, procedures, or behavioral strategies.
- Randomized controlled trials for livestock and food safety: [REFLECT](#) and [REFLECT checklist](#)
- Systematic reviews and meta-analyses: [PRISMA](#)
- Trial protocols: [SPIRIT](#)

Sex and gender equity

We endorse the [SAGER guidelines \(Sex and Gender Equity in Research\)](#) and encourage authors to include sex and gender considerations where relevant. As such, for studies involving organisms capable of sex and/or gender differentiation, whether human or not, authors should:

- use the terms sex (biological attribute) and gender (shaped by social and cultural circumstances) carefully to avoid confusing both terms;
- specify in the title and abstract what sex(es)/gender(s) the study applies to;
- disclose whether and what sex/gender differences were expected;
- design and conduct the research in a manner that can reveal sex- and/or gender-related differences;
- report data disaggregated by sex and gender;
- discuss the potential implications of sex and gender on the study results and analyses; and
- if a sex and/or gender analysis was not conducted, provide a rationale in the Discussion section.

Spelling

Authors are responsible for consistency in spelling.

- In English, follow [Merriam-Webster](#) or the [Oxford English Dictionary](#).
- In French, follow [Le Robert](#) or [Le grand dictionnaire terminologique](#).

Statistical analyses

The assumptions and (or) the model underlying any statistical analysis should be clearly stated. Do not use symbols such as * and ** to denote levels of significance unless accompanied by actual *p* values.

Territorial descriptions

Depictions and descriptions of sovereign and territorial boundaries included in submitted manuscripts

- should focus on area(s) directly relevant to the work being reported, and
- must follow internationally recognized treaties, conventions, and law.

Publisher and journal staff reserve the right to require map and text revisions to satisfy this policy. Authors who are not willing to meet these requirements may be asked to withdraw their work from consideration.

Units of measure

Use SI units of measure ([Système international d'unités](#)). If non-SI units are used, at first mention, the equivalent in SI units should be supplied in parentheses.

Artificial intelligence

Authors are responsible for ensuring the integrity and factual accuracy of their work and for appropriate attribution of all sources. Authors should:

- Verify all outputs of generative artificial intelligence (genAI) tools used in the research and in production of the article.
- At submission, disclose all use of AI-assisted tools in the article, including the name and model/version of the tools.
- Writing assistance and language improvement should be described in the Acknowledgements.
- Use of tools to design or conduct research must be described in the Methods. We encourage authors to include input prompts and AI outputs as supplementary files.
- Cite all sources, ensuring the reference list is complete and accurate, and that tools used have not reproduced substantial portions of other people's work amounting

to plagiarism of text and images.

- Regarding article figures: GenAI may not be used to create or alter illustrations and photos (including micrographs and radiographs) but may be used to create figures based on original data so long as its use is described in the text.
- Refrain from listing AI tools as authors.

Editors may reject manuscripts if AI-assisted technologies are used inappropriately or used but not declared.

See our [full policy on appropriate and inappropriate use of generative AI in research and publishing](#).

Parts of the manuscript

(Check requirements for journals that use [double-anonymous peer review](#))

Title page

Title

The title should be accurate, informative, and brief. Keywords should be included in the title to optimize search engine discovery. Limitations such as study design or population that would affect the understanding of the study should be delineated.

e.g.:

- for interventional health studies, it is best practice to include the type of study design in the title (randomized or nonrandomized controlled trial, pre-post study, crossover study)
- for studies where the entire population is of the same sex, specify the sex in the title
- for animal studies that could be mistaken for human clinical research, specify the animal model in the title

Author list

List all author names on the title page: check author order, spelling, capitalization, initials, and hyphens.

- Format names as: first name (or initial) middle name (or initial) last name (surname/family name).
- List affiliation(s) for each author that include: institution (department and university or organization), city, state or province, country. An author's affiliations should reflect where the research was conducted. If an author changes institution, the new affiliation can be listed in a footnote.
- Do not include academic degrees and professional titles.
- Joint authorship, if applicable, should be indicated in a note on the title page as follows: "AUTHOR A and AUTHOR B should be considered joint first authors."

Authorship criteria: Canadian Science Publishing subscribes to the [ICMJE definition of authorship](#) in most cases. Any person listed as an author must meet each of these authorship criteria, and anyone who meets these authorship criteria must be listed as an author. Contributors who do not meet authorship criteria should be listed in the Acknowledgements section, with their express permission. Exceptions to our definition of authorship may exist for community-engaged research projects; please see our [Publishing Policy](#) for authorship and attribution options. Generative AI tools do not qualify for authorship and cannot be included in the author list.

Corresponding author

Clearly identify the corresponding author and their email address on the title page. The corresponding author is designated to receive post-publication queries from readers.

Note that authors may supply their ORCID ID on submission; these identifiers are not required on the title page itself.

Abstract

Provide the abstract in the manuscript text file on page 2, after the title page. Authors must supply their abstract in English and/or French. (Note that CSP plans to accommodate author-provided abstract translations in other languages in the future.)

The abstract should be a single paragraph that summarizes the article, unless otherwise noted in the journal-specific guidelines. Briefly describe the study rationale, objectives, methods, findings (including significance), and impact. Use keywords (and their plain-language synonyms) in the abstract to optimize search engine discovery. Do not include reference citations, tables, figures.

Study registration is required for clinical trials, which must have been registered in a publicly accessible clinical trial registry before patient enrolment. For observational studies and systematic reviews, registration is highly recommended, and some of our journals require it; consult journal-specific guidelines for more information. For all registered studies, report the name of the registry and registration number at the end of the abstract.

Example:

... erat scelerisque justo, nec congue turpis nisi non urna.
Mauris tristique enim vel est semper, at efficitur nisl tristique.

Registration: Clinicaltrials.gov, no. 84104957.

Keywords

List keywords after the abstract. Use keywords in the title, abstract, and manuscript text to optimize search engine discovery.

Graphical abstract

(Optional) Authors are encouraged to submit an illustration, diagram, equation, or other informative visual that explains the central message of the article and entices readers. The maximum allowable size is 40 mm (150 pixels) high by 85 mm (320 pixels) wide.

Main body of the article

Introduction

Explain the study rationale and objective(s).

- Clearly define a research question and describe its importance.
- Establish context: discuss the existing body of knowledge on the topic, including references to the key literature, and note gaps or controversies in the field.
- What is the overall aim of the study? State how your study will provide new insight into the field.

Materials and methods

Describe what you did (and how you did it) clearly and comprehensively enough that the study can be reproduced.

- Include as appropriate the study design; primary and secondary outcome measures; computational, experimental, and statistical methods; materials; locations.
- Specify materials used (e.g., laboratory or field equipment, chemicals, biologic materials, software) and their sources (provide company name, country in parentheses).
- Report the use of AI tools to design or conduct research (e.g., developing the study question; collection and/or analysis of data; generating tables, figures, or computer code). We encourage authors to include input prompts and AI outputs as supplementary files.

Ethics approval

Information about ethics approval should be reported in the Materials and Methods section (usually the first paragraph).

Animal studies

Studies involving animals, specifically vertebrates and cephalopod class invertebrates, including free-living and reproducing larval forms, must comply with internationally accepted standards, regulations, and guidelines, and be conducted with the highest regard for animal welfare. In the Materials and Methods section, authors must supply details on regulatory compliance, ethics approvals, and permits from the relevant jurisdictional authorities (both home institution/country and study site, if different). Authors are also encouraged to describe how the [3Rs of ethical animal research](#) (replacement, reduction, and refinement) informed their study design.

Ethics approval

Confirm that the study received prior ethics approval (or a waiver/exemption) from the appropriate authority, e.g., institutional animal care and use committee (IACUC), institutional review board, or country-specific equivalent. Name the ethics authority and provide the approval number and date of approval. If ethics approval was waived or not sought, explain the reason(s).

Sample ethics statement:

- Ethics approval was obtained from NAME OF INSTITUTIONAL ANIMAL CARE AND USE COMMITTEE (APPROVAL NUMBER) before starting the study.

Field permits

Permits for field and observational work must be obtained before conducting the research. Name the authority that granted approval to access field sites and include the research permit or license number (e.g., Scientific Research License or Wildlife Research permit in Canadian Territories). If none were obtained, explain the reason(s).

Animal care

State the animal care guidelines and regulations that were followed during the study.

Sample animal care statement:

- The study was conducted in accordance with NAME OF ANIMAL CARE REGULATION OR GUIDELINE.

Provide details about the animals used in the study, including standards of care, steps taken to minimize animal distress, and the fate of the animals at the end of the study, e.g.:

- species, number, sex, age, weight;
- source of animals used in the study (e.g., purchased, purpose-bred, privately owned, wild-caught, random sourced like fish from a bycatch or shelter animals);
- method of capture for wild caught animals;
- housing and husbandry;
- products administered to or used on the animals (e.g., drugs, feeds, devices);
- surgical procedures and other interventions;
- pain and stress management (anesthetic/analgesic/tranquilizing agents);
- predetermined experimental endpoints (for mortality endpoints, describe the rationale and plan/criteria for determining the endpoint);
- method of euthanasia for studies that use death as an endpoint. The method must align with the most recent [AVMA Guidelines for the Euthanasia of Animals](#).

Editors reserve the right to subject articles to additional ethics scrutiny as warranted, e.g., work from jurisdictions with no regulatory or ethics oversight for animal research or whose practices are far outside internationally accepted norms, work involving [vulnerable or endangered species](#), work conducted on a location of cultural significance to partner Indigenous communities.

Cell lines

In reporting what cell lines they used, authors must describe the source of the cell lines, including company name if purchased from a life sciences company.

For de novo cell lines derived from human tissue, authors must confirm that they obtained approval from an institutional review board or equivalent ethics committee and consent from the donor or next of kin.

To ensure cell lines used are not misidentified or

contaminated, authors should also refer to the [ICLAC Register of Misidentified Cell Lines](#).

Global and community-engaged research

For work conducted in a region or community where some or all authors have no local affiliation:

- name the local authority that provided ethics approval and/or permits, and
- confirm you received consent for publication from community leaders/representatives.

Depending on the nature of the reported work, editors may request a community involvement or positionality statement in the manuscript or ask authors to follow CSP's guidelines on reporting [community-engaged research](#).

Human participant studies

Studies that involve human participants, their data or biological material must adhere to the principles outlined in the [Declaration of Helsinki](#). Authors must provide statements in the Materials and Methods that include the following details, as relevant.

Ethics approval

Confirm that the study received prior ethics approval (or a waiver/exemption) by the appropriate institutional review board (IRB) or equivalent ethics committee. Name the IRB or ethics committee and provide the approval number. If ethics approval was waived or not sought, explain the reason(s).

Retrospective ethics approval for clinical trials and interventional studies is not permitted. Consideration of other studies that received retrospective ethics approval is at the discretion of the editors.

Sample ethics statements:

- Approval was granted by the NAME OF ETHICS COMMITTEE (APPROVAL NUMBER).
- Ethical approval was waived by the NAME OF ETHICS COMMITTEE owing to the study's retrospective design and anonymized dataset.

- This is an observational study of pedestrian traffic patterns at a public intersection. The NAME OF ETHICS COMMITTEE confirmed that no ethical approval was required.

Informed consent for study participation

Confirm that human participants provided informed consent to participate in the study before it began and describe how consent was obtained. State whether consent was written or verbal. If consent was verbal, explain why written consent was not obtained. For studies involving vulnerable populations, e.g., minors or individuals with diminished capacity to consent, informed consent must have been obtained from each participant's legal guardian.

Sample statements for consent to participate:

- Written informed consent was obtained from all study participants before enrollment.
- Verbal informed consent was obtained from participants before each interview. Our local research partners (NAME OF COMMUNITY GOVERNMENT BODY) advised that conversation would be more culturally accepted than written forms.

Informed consent for publication

Study participants have a right to confidentiality surrounding their personal, potentially identifiable data. Do not include identifiable information in the article unless necessary.

If the article contains potentially identifiable participant data (e.g., name, date of birth, biometric characteristics, photos, video), confirm that participants or their legal guardians provided informed consent for publication of their data. This should include sharing the article with the individual, so they are aware of the content and any images used, as well as the implications for reuse if published open access. The requirement for participant consent to publish identifiable information cannot be waived by an ethics committee.

Sample statements for consent to publish:

- The patient consented to publication of this case report.

- Additional consent for publication was obtained from individual participants whose identifying information is included in the article.

Specimens

Confirm that research involving collection of specimens was conducted in accordance with all applicable laws, guidelines, regulations; and if permits were required for fieldwork, supply the research permit and (or) license numbers.

Please also include location, date, and environmental factors relevant to the collection of specimens in the Materials and Methods section. Authors are encouraged to make these data available in a publicly accessible data repository and to provide the data accession number.

Results

Report results that are directly relevant to the research question underpinning the study. Raw data and other observations may be submitted with the manuscript as Supplementary files or uploaded to a recognized data repository.

- Use subheadings, tables, and figures to organize and communicate your findings.
- Begin sections and (or) sentences with high-level observations, followed by statistical data.
- In reporting statistical results, include as relevant:
 - data validation of pre-processed data (state which assumption checks—e.g., for linearity, co-linearity, normality of the distribution—were performed and provide results);
 - data transformations of pre-processed data (state which variables were transformed, how, and why);
 - the statistical tests used;
 - descriptive statistics with clearly defined measures of variance (e.g., standard deviation, range, confidence intervals) and central tendency (e.g., mean, median, mode);

- test statistics and associated degrees of freedom;
- exact p-values for all values ≥ 0.001 (report to 3 decimal places for values < 0.01 and to 2 decimal places for values ≥ 0.01);
- numerator (n) and denominator (N) values when describing percentages, proportions or ratios;
- an explanation for how outliers and missing/excluded data were handled.

Discussion or Conclusion

These sections may be combined or differentiated. Together, these sections should discuss the findings of the study, placing them into the context of the existing body of work, the research question, and a reasonable interpretation of the results. The limitations of the study and main contributions of the work should be detailed. Avenues of future study may be outlined here. Speculation should be clearly identified and based on observations related to the manuscript.

Author statements

Acknowledgements

(Optional) The names and contributions of institutions and people who contributed to the work but do not meet authorship criteria may be listed in the Acknowledgements section. Authors are responsible for ensuring that people named in the Acknowledgements agree to be named. If AI technology was used for writing assistance or language improvement, name the AI tool and describe how it was used in the Acknowledgements (e.g., translation, drafting, summarizing, paraphrasing, correcting spelling and grammar).

Author contribution statement

Supply an author contribution statement, identifying authors

by their initials and specifying contributions using the [Contributor Roles Taxonomy \(CRediT\)](#) roles as selected for each author in the peer-review system during submission.

Community involvement statement

(Optional) For global or community-engaged research, or studies involving Indigenous partners, authors may supply (and editors may request) a community involvement statement that describes how the community was involved throughout the research process and how the study benefits the community. For information on how to transparently report different aspects of community-engaged projects throughout the article itself, refer to our [community-engaged research page](#).

The community involvement statement should

- state which community body provided consent and how participant consent was collected (if applicable),
- describe how the community was involved (e.g., study design, data collection, analysis),
- detail how the results were communicated back to the community and explain how the community's concerns were addressed.

Competing interests statement

Authors are responsible for disclosing all financial and non-financial relationships that might bias or be seen to bias their work. Supply a statement of competing interests during submission. Authors who are unsure what to list may wish to consult the [ICMJE form for disclosure of competing interests](#).

- If there is nothing to declare, the statement should read: "The authors declare there are no competing interests."
- If there are competing interests to declare, specify authors by full name. Statements should take the form of "AUTHOR is an employee and shareholder of COMPANY. AUTHOR has received speaker fees and travel honoraria from COMPANY."

Data availability statement

Supply a data availability statement that says whether any, all, or portions of the data underpinning the work are available to others. Please refer to journal-specific guidelines for additional requirements on data availability.

- If data are available, specify how data can be accessed and under what conditions data can be reused. Supply repository name, persistent unique identifier (PID: DOI/compact identifier/accession number), and web link.
- If data are not available, explain why (e.g., describe the ethical, legal, or commercial restrictions).

For clinical trials, the data sharing statement should follow [ICMJE guidelines](#).

For complete instructions, see [How to write a data availability statement](#).

Funding statement

Supply a funding statement that lists what support the authors received to carry out the research.

- If the study was unfunded, state “Funding: The authors declare no specific funding for this work.”
- If the study received funding, include each funding agency name written out in full, followed by its grant or award number in parentheses. E.g., “Funding: This research was supported by FUNDING AGENCY NAME (grant No. ###).”

Positionality statement

(Optional) For studies involving global or community-engaged research, where researchers worked in or with community groups they may not belong to themselves, authors may provide a positionality statement that describes how their unique identities, experiences, beliefs, or relationships with the research and community partners played a role in the research process.

References

See journal-specific guidelines for information on preferred citation style. Note the following:

- Unpublished reports, private communications, and submitted manuscripts do not belong in the reference list. Include them as footnotes or parenthetically in the body text, e.g., (J. Jones, personal communication, 2010).
 - Books and articles that are in press (accepted but not yet published) should be cited in the text and included in the reference list. Editors may request a copy of the referenced work if it has been accepted but remains in press.
 - Publicly available datasets should be cited in text and included in the reference list (see [How our How to cite datasets section](#)).
-

Tables and Figures

In general:

- Cite each figure and table and name them in order of first appearance in the text (Figure 1, Figure 2, Table 1, Figure 3, Table 2, etc.).
- Figures and tables should add information to the article, not duplicate results that are (or could be) explained briefly in the text.
- Figures and tables should be understandable without having to read the article. Any abbreviations or symbols used should be defined in the caption (figures) or in the Note (tables).

Table specifications:

- Supply tables in an editable format, i.e., Word (table

function in DOC or DOCX) or Excel (spreadsheet in XLS or XLSX). Each data point should be in a separate cell.

- Provide a table caption (e.g., Table 1. Xxx).
- Footnotes should be designated by symbols (order: *, †, ‡, §, ||, ¶, #) or superscript lowercase italic letters (^{a,b,c}).
- Use a Note under the table for additional information.

Figure specifications:

See [How to prepare figures](#) for figure specifications and guidance.

- There are specific reporting requirements for [Western blots/immunoblots and gels](#).
- GenAI may not be used to create or alter illustrations and photos (including micrographs and radiographs) but may be used to create figures based on original data so long as its use is described in the text.

A caption explains how to read a figure, independent of the article text. Follow the guidelines below:

- Terms, abbreviations, and symbols used must be defined and correspond with those in the text.
- List tools and settings used for image capture.
- Maps: captions must credit all sources used to produce the map: base map if used (e.g., [Google Map attribution guidelines](#)), and data plotted on the map (e.g., geological units and contacts, shape file data, boundary file data, data from other studies). List map projection (e.g., NAD83) and coordinate system (e.g., UTM) used, if applicable.
- Include a permission statement for figures adapted, modified, or republished from elsewhere. Upload a copy of your permission from the original copyright holder with your files, or send by email to the journal editorial office.

Appendices

An appendix comprises a separate, self-contained document. Figures, equations, and tables used in an appendix should be numbered sequentially but separately from those used in the main body of the paper, e.g., Fig. A1, eq. (A1), Table A1.

Supplementary files

Supplementary files consist of extra tables, figures (maps), detailed calculations, and data sets produced by the authors as part of their research, but not essential for understanding or evaluating the manuscript.

- Number figures, equations, and tables in a supplementary file sequentially but separately from the numbering used in the manuscript (e.g., Fig. S1, eq. S1, Table S1).
 - Cite supplementary files in the manuscript in a footnote.
 - During submission, use the “Supplementary Material” file designation when uploading supplementary files.
 - Supplementary files are not edited or converted, and, therefore, will appear exactly as submitted.
 - Supplementary files should be named by manuscript number followed by “suppla”, “supplb” etc. e.g., APNM-2019-0401suppla.
-

Guidelines per Journal

Please select the information you want to see:

Canadian Journal of Forest Research

Author Guidelines for

Canadian Journal of Forest Research

SUBMIT ARTICLE

Les directives aux auteurs propres à la Revue sont disponibles [en français](#).

Abstract

Abstracts should not exceed 200 words for all article types.

Length per manuscript type

Article type	Description	Specifications (word, table/fig, reference limits)
Research article	Reports in a concise manner the results of a substantial, completed work.	Typically limited to 6000 words from the Introduction through the end of the Discussion and 50 references. Exceptions on length are made depending on topic, and manuscripts that are considered too long will be returned to the author for shortening before peer review; the abstract should not exceed 200 words.

Review	A critical review or synthesis of information on an important forest-related topic. • A critical and comprehensive review and synthesis of the literature on an important topic. Should emphasize synthesis over comprehensiveness • A synthesis of the outcomes of a long-term experiment or series of studies on a specific topic. Should provide new insight and knowledge beyond that found in previous publications. Could include meta-analysis.	Reviews/syntheses can exceed the length limits of articles, but length concerns should be discussed with the Editor-in-Chief prior to submission.
Note	Reports an original, completed and noteworthy project of narrow scope.	Should not exceed 3500 words from the Introduction through the end of the Discussion and 30 references, unless justified by exceptional information content; abstract should not exceed

		150 words.
Discussion and Reply	Discussions of recently published papers may be accepted for publication, if they are brief and of a technical or interpretative nature. Replies to such discussions are invited from the original authors and are generally published at the same time. See the full description of this article type here .	
Perspective	A focussed, well-argued article that presents a novel idea or perspective that challenges current thinking on forest science issues.	Main body text should not normally exceed 5000 words. Abstract and references are required.
Methods Paper	Focuses on the validation of new methodology and should meet two criteria: (i) the new or modified method must be compared with existing protocols to suggest the work presents either a technological advance and/or confers some advantage over existing methods, and (ii) experimental protocols	5000 words including references, tables and figures.

	and timelines must be clearly outlined, and the data analyzed statistically.	
Data Paper *	Presents and describes a dataset (or datasets) in full, including the context, collection, and reuse potential of the data.	5000 words including references, tables and figures.

*** Data Paper Instructions**

Data papers should present a dataset (or datasets) relevant to the research community to promote discoverability and reuse of research data. Data papers should describe datasets in full, including the data’s purpose, collection, and reuse potential, but shouldn’t generally test hypotheses or provide any interpretations. Datasets must be deposited in a publicly accessible repository and licensed for reuse.

Key components of a data paper:

- Overview of the project(s) that generated these data.
- Summary and citation of all publications derived from these data to date.
- Description of the data collected and the extent of the dataset (e.g., geography, time range).
- Description of data collection protocol such that other researchers can understand and reproduce the methods (includes procedures used to produce or gather data, experimental design, and any equipment or software used).
- Description of technical analyses or validation methods used to support the quality of the measurements and reliability of the data.
- Discussion of limitations (e.g., data gaps, changes in methods, instrumentation) and potential sources of error.

- Discussion of the dataset's value to the research community in terms of the journal scope: explains who can benefit from these data and provides examples for reuse
- Instructions, code, workflows, or tips that may assist other researchers with reuse of these data.
- Link to the dataset with full citation

In all cases, all figures and tables should be necessary to support the text. Additional information or material can be uploaded as Supplementary Material but must be referenced in the text. **All submissions must be line numbered.**

Data Sharing

To further our commitment to Open Science and to enhance transparency and reproducibility in the research we publish, Canadian Journal of Forest Research has partnered with Dryad (<http://www.datadryad.org>), a nonprofit data repository. Through the end of 2026, authors publishing with Canadian Journal of Forest Research can deposit their data and code in [Dryad](#)'s data repository for free using a provisional URL provided in the email notification confirming submission of their manuscript.

Nomenclature

As a general guide for biological terms, [Scientific Style and Format: The CSE Manual for Authors, Editors, and Publishers](#) (8th ed., 2014)), published by the Council of Science Editors, is recommended.

For enzyme nomenclature, refer to *Enzyme Nomenclature (1992): Recommendations of the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology* (Academic Press, San Diego, California).

For botanical nomenclature, the International Code of Botanical Nomenclature (International Association for Plant Taxonomy) should be followed. Note that the first occurrence of a species name in a manuscript is presented with the genus written in full and the authority name(s) included (e.g., *Populus angustifolia* James). In subsequent mentions of the same species, the genus is abbreviated to the first letter and no authority name(s) is listed (e.g., *P. angustifolia*).

To avoid confusion, when different genera share the same first letter, the genera are written in full throughout the manuscript. Genera are always written in full at the beginning of a sentence.

References

This journal uses the Harvard citation style. In-text reference citations take the form (author year). References must be listed in alphabetical order according to the name of the first author and not numbered. References with the same first author are listed in the following order.

1. Papers with one author only are listed first in chronological order, beginning with the earliest paper.
2. Papers with dual authorship follow and are listed in alphabetical order by the last name of the second author.
- Papers with three or more authors appear after the dual-authored papers and are arranged chronologically. Include DOIs and hyperlinks whenever possible, and do not number the references.

Examples of common reference types used in the journal

Book:

Philip, M.S. 1994. Measuring tree crops. In *Measuring trees and forests*. 2nd ed. CAB International, Wallingford, UK. pp. 107–150.

Book in a series:

Scott, W.B., and Crossman, E.J. 1973. Freshwater fishes of Canada. *Bull. Fish. Res. Board Can.* No. 184.

Note

We encourage the submission of manuscripts written by, with, or for Indigenous Traditional Knowledge keepers to ensure the protection of Traditional Knowledge with/for/by Indigenous Peoples. Submitted manuscripts examining Indigenous knowledge will have to demonstrate that the research was ethically conducted with respect of Indigenous Peoples. The submissions will have to follow these principles: *(i)* research has received appropriate Indigenous Research Ethics approval, *(ii)* true and informed consent was sought a priori before the start of the research, *(iii)* data were returned to the People where they belong for the protection and preservation of their Indigenous knowledge, and *(iv)* Indigenous Peoples have approved the submission of the manuscript.
